Rhondda Cynon Taff
Progress Report on
Population and Dwelling Projection

Introduction

This is a progress report on the population and dwelling estimation for Rhondda Cynon Taff. It comprises four separate projections, each based on different trend assumptions. It is a “work in progress” report, which uses the presently available information. Examination of these projections will possibly lead to further refinements and to a single preferred projection. There are four projections with two each of the two basic types of projection presented here. The first type is dwelling based – using estimates of likely sites that may be evenly phased over the plan period. Two dwelling estimate rates are presented here. The second is a migration based projection – using past migration patterns continued into the future. Two migration based projections are presented here, one trend from 1981 to 2001 and one more recent trend from 1996 to 2001.

Dividing the Area for the Projection

The area of Rhondda Cynon Taff comprises significantly different population, dwelling and housing market characteristics. A single county wide projection would not show the individual differences in these areas. Because of this the area has been divided into 12 different zones and a projection has been made for each zone for each of the four alternative projection assumptions. The areas are aggregations of wards and the aggregation is shown in Appendix 1

Medium Building Estimate

A maximum dwelling estimation has been made by RCT officers to use as an upper limit of building over the plan period. This formed the basis of the upper and medium build figures. The medium build figures are simply half the upper build estimates. Also the build estimates in the present projections are spread evenly. Clearly more accurate estimates will be made when more information regarding development sites becomes available. Table 1 summarises and Appendix 2 shows in detail the results of the projection using the medium build rate estimate. The housing allocations which are used as a basis for this calculations are shown in Appendix 7

Upper Building Estimate

A maximum dwelling estimation has been made by RCT officers to use as an upper limit of building over the plan period. This formed the basis of the upper and medium build figures. The medium build figures are simply half the upper build estimates. Also the build estimates in the present projections are spread evenly. Clearly more accurate estimates will be made when more information regarding development sites becomes available. Table 2 summarises and Appendix 3 shows in detail the results of the projection using the upper build rate estimate. The housing allocations which are used as a basis for this calculation are shown in Appendix 7.

Historic Migration Estimate

The average migration rate from 1981 to 2001 has been used to make a projection. The long term rate shows a net outflow of population for the area. The long term rate is fairly reliable but obviously does not take into account any recent pattern changes such as international migration or economic success which may be a better indicator. Table 3 summarises the results of the projection using the long term migration pattern as the basis of the projection.

Recent Migration Estimate

The average migration rate from 1996 to 2001 has been used to make a projection. The recent rate shows a net inflow of population for the area. This is the migration rate that is presently being used by the Welsh Assembly Government for its projections. Table 4 summarises the results of the projection using the recent term migration pattern as the basis of the projection.

Household correction (var 2) (D)Hholds cor. Cen2001

No local edits file.
Onscreen edits have been made to
Control type .

With modelling options
In migration profiles. Out migration profiles.
Composite head/hhold representative rates.
Institute pop. is proportional to domestic pop. for some age bands.
Base dwellings are calculated.

Mortality rates applied to non-transient population.
Local corrections are calculated.

Notes on the standard report.

1. Average household size = (total - inst. pop.)/total households.
2. Start population births and deaths result from applying fertility and mortality to the population at the start of a period. The end population births and deaths are an estimate of the registrations in that area.
3. Calculated local corrections use the default data for net migration control and international migration.

Appendix 3

Detailed Population Projection for Upper Building Estimate

This appendix shows the results of the Chelmer Population and Housing Model (CPHM) for RCT and zones. The high build rate is assumed even over the projection period.

No local edits file.

Onscreen edits have been made to

Control type

With modelling options

In migration profiles. Out migration profiles.

Composite head/hhold representative rates.

Institute pop. is proportional to domestic pop. for some age bands.

Base dwellings are calculated.

Mortality rates applied to non-transient population.

Local corrections are calculated.

Notes on the standard report.

1. Average household size = (total - inst. pop.)/total households.
2. Start population births and deaths result from applying fertility and mortality to the population at the start of a period. The end population births and deaths are an estimate of the registrations in that area.
3. Calculated local corrections use the default data for net migration control and international migration.

Appendix 4

Detailed Population Projection for Migration Rate from 1981 to 2001

This appendix shows the results of the Chelmer Population and Housing Model (CPHM) for RCT and zones. The average migration rate from 1981 to 2001 was assumed to continue over the projection period.

No screen edits have been made.

With modelling options

In migration profiles. Out migration profiles.

Composite head/hhold representative rates.

Institute pop. is proportional to domestic pop. for some age bands.

Base dwellings are calculated.

Mortality rates applied to non-transient population.

Local corrections are calculated.

Notes on the standard report.

1. Average household size = (total - inst. pop.)/total households.
2. Start population births and deaths result from applying fertility and mortality to the population at the start of a period. The end population births and deaths are an estimate of the registrations in that area.
3. Calculated local corrections use the default data for net migration control and international migration.

Appendix 5

Detailed Population Projection for Migration Rate from 1981 to 2001

This appendix shows the results of the Chelmer Population and Housing Model (CPHM) for RCT and zones. The average migration rate from 1996 to 2001 was assumed to continue over the projection period.

This basis for a population projection is also presently being used by the Welsh Assembly Government

No screen edits have been made.

With modelling options

In migration profiles. Out migration profiles.

Composite head/hhold representative rates.

Institute pop. is proportional to domestic pop. for some age bands.

Base dwellings are calculated.

Mortality rates applied to non-transient population.

Local corrections are calculated.

Notes on the standard report.

1. Average household size = (total - inst. pop.)/total households.
2. Start population births and deaths result from applying fertility and mortality to the population at the start of a period. The end population births and deaths are an estimate of the registrations in that area.
3. Calculated local corrections use the default data for net migration control and international migration.

Appendix 6

Initial Housing Allocations

This table shows the best estimate in Spring 2006 of maximum feasible development.

Initial Housing Allocations					
Spring 2006					
Zone	Comment	Estimated New Dwellings	Conting ency	5 Year Build Rate	
				mid rate	hi rate
